Access your Google+ Video Library directly from the app. If you're a Google+ user and you want to keep your library organized, you're in luck. The new Google+ app comes with a feature called the Google+ Video Library. This app feature allows you to pull your YouTube, Vimeo, and your saved videos directly from the app. To access this functionality, open the new Google+ app and scroll down to the bottom of the Google+ app. Once you're there, tap the blue "Updates and improvements" button on the upper right corner. This will expand to show all of the Google+ updates, and will direct you to the options where you can access this new video feature. The best part about this feature is that you don't have to download anything. The app just pulls it straight from your Google+ account. You can also share your videos through the same mechanism. In order to do that, just tap the share button in the upper right corner of your video, and tap the share option under the "With whom do you want to share?" list. Once you've shared the video, you'll be able to access it directly from the Google+ app. In order to make the Google+ Video Library more useful, Google is also adding in some helpful features. For example, now when you create a new Google+ profile, there's a dedicated option called "movies and TV" where you can see all of your saved videos. You can also add videos to a specific project. For example, you could create a video for a presentation or a presentation for a video. These features are still in beta, and Google will slowly roll them out over the coming weeks. Effect of temperature on the development of porcine parvovirus (PPV) in vitro. The effect of temperature on the development of porcine parvovirus (PPV) in tissue culture cells was investigated. Viral replication and virus-induced CPE were tested at various temperatures: 32 degrees, 37 degrees, 42 degrees, and 48 degrees C. At 32 degrees and 37 degrees C, there was a clear correlation between the development of CPE and virus replication, but the increase in incubation temperature to 42 degrees and 48 degrees C had only a marginal effect on virus replication. At the higher temperatures, virus-induced CPE appeared to be delayed or completely 82157476af
